

OVARIAN REJUVENATION PRP - PLATELET-RICH-PLASMA

A therapeutic approach for restoring the quality of the ovarian reserve.

- 1 This approach includes injection of a patients' own PRP (platelet-rich-plasma) into ovaries or uterine cavity and has resulted in multiple pregnancies for patients that previously had no hope.
- 2 Using PRP is ideal for patients who experience POF "Premature Ovarian Failure," DOR "Diminished Ovarian Reserve," Perimenopause and Embryo Implantation Issues.
- 3 The process begins with the patient getting administered IV sedation followed by injection of PRP into the ovary.
- 4 Post the procedure the patient will go to recovery and may feel some cramping. She will be able to rest around one hour prior to being discharged to return home accompanied by a family member or friend.
- 5 The best outcome of PRP is a chance to become pregnant using a patients own eggs.
